Docket No: ORRCP0100US

(Currently amended) A process for removing a source-derived contaminant from a hydrocarbon-containing material, comprising

contacting the hydrocarbon-containing material with a clay in a filter apparatus at a temperature in the range from about 50°C to about 180°C, at least part of the source-derived contaminant being sorbed by the clay; and

CLAIMS

removing hydrocarbon-containing material from the filter apparatus, wherein the removed hydrocarbon-containing material comprises a reduced amount of the source-derived contaminant and the process does not include additional or separate steps to remove any contaminant after the contacting step.

- 2. (Original) The process of claim 1, wherein the source-derived contaminant is a polymer-derived contaminant.
- (Original) The process of claim 1, wherein the source-derived contaminant comprises one or more of an organic chlorine compound, a nitrogen compound, sulfur or an organic or inorganic sulfur compound, color, or an offensive or non-hydrocarbon odor.
- 4. (Previously presented) The process of claim 1, wherein the removed hydrocarbon-containing material is a refinery-grade hydrocarbon.
- (Previously presented) The process of claim 1, wherein the removed hydrocarbon-containing material is blended with another hydrocarbon to obtain a refinery-grade hydrocarbon.

Docket No: ORRCP0100US

(Original) The process of claim 1, wherein the hydrocarbon-containing material is obtained from thermal decomposition of polymeric or other organic materials.

- (Original) The process of claim 6, wherein the polymeric material comprises an unsorted mixture of a plurality of thermoplastic polymeric materials.
- (Original) The process of claim 6, wherein the other organic material comprises one or more of animal offal, manure, crop residuals and plant residuals.
- (Original) The process of claim 1, wherein the clay comprises Fuller's earth.
- 10. (Currently amended) A process for producing hydrocarbons from a polymeric material, comprising:
- (a) thermally decomposing polymeric material to obtain a first hydrocarboncontaining material comprising one or more polymer-derived contaminant:
- (b) contacting the first hydrocarbon-containing material with a clay material at a temperature in the range from about 50°C to about 180°C to form a clay-hydrocarboncontaining material mixture, whereby at least a portion of the polymer-derived contaminant is sorbed by the clay material to form a clay-contaminant adduct; and
- (c) separating a second hydrocarbon-containing material from the mixture, wherein the second hydrocarbon-containing material comprises a reduced amount of the polymer-derived contaminant and the process does not include additional or separate steps to remove any contaminant after the contacting step.
- 11. (Original) The process of claim 10, further comprising (d) heating the clay material and the clay-contaminant adduct to an elevated temperature to regenerate the clay material.

- (Original) The process of claim 11, wherein in (d) the clay material and the clay-contaminant adduct are heated to a temperature in a range from about 400°C to about 815°C.
- 13. (Original) The process of claim 11, further comprising (e) providing the regenerated clay material from (d) to (b).
- (Original) The process of claim 13, further comprising repeating steps
 (a)-(e).
- 15. (Original) The process of claim 10, wherein the polymer-derived contaminant comprises one or more of an organic chlorine compound, a nitrogen compound, sulfur or an organic or inorganic sulfur compound, color, or an offensive or non-hydrocarbon odor.
- (Original) The process of claim 10, wherein in (a) the polymeric material comprises an unsorted mixture of a plurality of thermoplastic polymeric materials.
- 17. (Original) The process of claim 10, wherein in (a) the polymeric material is thermally decomposed at a temperature from about 300°C to about 500°C.
- 18. (Original) The process of claim 10, wherein the second hydrocarbon-containing material has one or more characteristic out of specification for a desired use.
- 19. (Original) The process of claim 18, further comprising (f) blending the second hydrocarbon-containing material with a petroleum-derived or synthetic hydrocarbon material to adjust one or more said characteristic to meet specification for the desired use.

- (Original) The process of claim 19, wherein the another petroleumderived or synthetic hydrocarbon material comprises a recycled material.
- 21. (Original) The process of claim 20, wherein the recycled material comprises one or more of engine lubricating oil, gear oil or fuel oil.
- 22. (Original) The process of claim 18, wherein the desired use is as one or more of a motor vehicle fuel, a lubricant, a hydraulic fluid, and a solvent.
- 23. (Original) The process of claim 10, wherein, in addition to the first hydrocarbon material, (a) yields a second combustible material.
- 24. (Original) The process of claim 23, wherein the second combustible material is combusted as a heat source in the process.
- 25. (Currently amended) A process for producing a hydrocarbon suitable for use in a motor vehicle from a recycled polymeric or other organic material, comprising:
- (a) providing a first hydrocarbon -containing material obtained from thermal decomposition of a recycled polymeric or other organic material, wherein the first hydrocarbon -containing material comprises one or more source-derived contaminant;
- (b) contacting the first hydrocarbon -containing material with a clay material at a temperature in the range from about 50°C to about 180°C to form a clay-hydrocarbon -containing material mixture, whereby at least a portion of the source-derived contaminant is sorbed by the clay material to form a clay contaminant adduct;
- (c) separating a second hydrocarbon -containing material from the mixture, wherein the second hydrocarbon -containing material comprises a reduced amount of the source-derived contaminant, and wherein the second hydrocarbon -containing

material has one or more off-specification characteristic relating to use in a motor vehicle:

- (e) providing another hydrocarbon material, wherein the another hydrocarbon material has one or more characteristic for offsetting the one or more off-specification characteristic; and
- (f) blending the second hydrocarbon -containing material with the another hydrocarbon to obtain a hydrocarbon wherein the one or more characteristic is within specification for use in a motor vehicle.
- 26. (Original) The process of claim 25, further comprising (d) heating the clay and the clay-contaminant adduct to a temperature in a range from about 400°C to about 815°C to regenerate the clay material, and providing the regenerated clay material to (b).
- 27. (Original) The process of claim 25, wherein the process is continuous and further comprises (g) repeating steps (a)-(f).
- 28. (Original) The process of claim 25, wherein the use in a motor vehicle comprises one or more of use as a fuel, a lubricant and a hydraulic fluid.
- 29. (Currently amended) A process for producing a hydrocarbon suitable for a desired use from a recycled polymeric or other organic material, comprising:
- (a) providing a first hydrocarbon -containing material obtained from thermal decomposition of a recycled polymeric or other organic material, the first hydrocarbon -containing material comprising one or more source-derived contaminant;
- (b) contacting the first hydrocarbon -containing material with a clay material at a temperature in the range from about 50°C to about 180°C to form a clay-hydrocarbon

-containing material mixture, whereby at least a portion of the source-derived contaminant is sorbed by the clay material;

- (c) separating a second hydrocarbon -containing material from the mixture, wherein the second hydrocarbon -containing material comprises a reduced amount of the source-derived contaminant, wherein the second hydrocarbon -containing material has one or more characteristic requiring adjustment for a desired use;
- (e) providing another hydrocarbon material, wherein the another hydrocarbon material has one or more characteristic for offsetting the one or more characteristic requiring adjustment; and
- (f) blending the second hydrocarbon -containing material with the another hydrocarbon to obtain a blended hydrocarbon -containing material wherein the one or more characteristic is within specification for the desired use.
- 30. (Original) The process of claim 29, further comprising (d) heating the clay and the clay-contaminant adduct to a temperature in a range from about 400°C to about 815°C to regenerate the clay material, and providing the regenerated clay material from (d) to (b).
- 31. (Original) The process of claim 29, wherein the process is continuous and further comprises (g) repeating steps (a)-(f).
- 32. (Currently amended) A process for producing a hydrocarbon suitable for a desired use from a recycled polymeric or other organic material, comprising:
- (a) providing a first hydrocarbon -containing material obtained from thermal decomposition of a recycled polymeric or other organic material, wherein the first hydrocarbon -containing material comprises one or more source-derived contaminant and has one or more characteristic requiring adjustment for a desired use:

- (e) providing another hydrocarbon material, wherein the another hydrocarbon material has one or more characteristic for offsetting the one or more characteristic requiring adjustment;
- (f) blending the first hydrocarbon -containing material with the another hydrocarbon to obtain a blended hydrocarbon -containing material wherein the one or more characteristic is within specification for the desired use;
- (b) contacting the blended hydrocarbon -containing material with a clay material at a temperature in the range from about 50°C to about 180°C to form a clayhydrocarbon -containing mixture, whereby at least a portion of the source-derived contaminant is sorbed by the clay material; and
- (c) separating a second hydrocarbon -containing material from the mixture, wherein the second hydrocarbon -containing material comprises a reduced amount of the source-derived contaminant and has the one or more characteristic within specification for the desired use.
- 33. (Original) The process of claim 32, further comprising (d) heating the clay and the clay-contaminant adduct to a temperature in a range from about 400°C to about 815°C to regenerate the clay material, and providing the regenerated clay material from (d) to (b).
- 34. (Previously presented) The process of claim 32, wherein the process is continuous and further comprises (q) repeating steps(a)-(c) in sequence.
- 35. (Previously presented) The process of claim 1 wherein the removed hydrocarbon material is a refinery-grade material and is not subjected to either cracking or fractionation subsequent to the removing.

- 36. (Previously presented) The process of claim 10 wherein the second hydrocarbon material is a refinery-grade material and is not subjected to either cracking or fractionation subsequent to the separating.
- 37. (Previously presented) The process of claim 25 wherein the second hydrocarbon material is a refinery-grade material and is not subjected to either cracking or fractionation subsequent to the separating.
- 38. (Previously presented) The process of claim 29 wherein the second hydrocarbon material is a refinery-grade material and is not subjected to either cracking or fractionation subsequent to the separating.
- 39. (Previously presented) The process of claim 32 wherein the second hydrocarbon material is a refinery-grade material and is not subjected to either cracking or fractionation subsequent to the separating.
- 40. (Previously presented) The process of claim 1 wherein the filter apparatus comprises a column containing the clay and the hydrocarbon-containing material is passed through the column under pressure, such that the steps of contacting and removing are combined in a single operation.
- 41. (Previously presented) The process of claim 10 wherein the filter apparatus comprises a column containing the clay and the hydrocarbon-containing material is passed through the column under pressure, such that the steps of contacting and separating are combined in a single operation.
- 42. (Currently amended) The process of claim 25 wherein the filter apparatus comprises a column containing the clay and the hydrocarbon-containing

Docket No: ORRCP0100US

material is passed through the column under pressure, such that the steps of contacting and separating are combined in a single operation.

- 43. (Currently amended) The process of claim 29 wherein the filter apparatus comprises a column containing the clay and the hydrocarbon-containing material is passed through the column under pressure, such that the steps of contacting and separating are combined in a single operation.
- 44. (Currently amended) The process of claim 32 wherein the filter apparatus comprises a column containing the clay and the hydrocarbon-containing material is passed through the column under pressure, such that the steps of contacting and separating are combined in a single operation.
